UPDATE OF U.S. GREAT LAKES TRIBUTARY LOADINGS, 1979-80*

Gregory A. Lang

ABSTRACT. This report presents estimated annual loads to the Great Lakes from U.S. tributaries for Water Years 1979 and 1980. Total, monitored, and diffuse loads are tabulated for each of seven categories: total phosphorus, soluble orthophosphorus, suspended solids, chloride, total nitrogen, ammonia nitrogen, and nitrate (+ nitrite) nitrogen. This study updates two previous reports that give the load estimates for Water Years 1975-78.

1. INTRODUCTION

As part of the Pollution From Land Use Activities Reference Group (PLUARG) study, the Great Lakes Basin **Commission** produced a report entitled "United States Great Lakes Tributary Loadings" (**Sonzogni et al., 1978**), which gives annual U.S. Great Lakes tributary load estimates of total phosphorus, soluble orthophosphorus, suspended solids, chloride, **total** nitrogen, ammonia nitrogen, and nitrate (+ nitrite) nitrogen for Water Years 1975 and 1976. "Post-PLUARG Evaluation of Great Lakes Water Quality Management Studies and **Programs**" (**Sullivan et al., 1980**), produced by the Great Lakes Basin Commission for the U.S. Environmental Protection Agency, updated annual U.S. Great Lakes tributary load estimates of total phosphorus, soluble **orthophosphorus**, suspended solids, and chloride for Water Years 1977 and 1978.

The present study gives estimates of the annual Great Lakes loads from the **entire** U.S. **Great Lakes Basin** and from individual U.S. **hydrologic areas**, river basin groups, and lake basins for Water Years 1979 and 1980. The **resultsshowtotal**, monitored, and diffuse loads for total phosphorus, soluble orthophosphorus, suspended solids, chloride, **total** nitrogen, ammonia nitrogen, and nitrate (+ nitrite) nitrogen.

These parameters include those selected in **previous** studies (**Sonzogni et al., 1978**, and **Sullivan et al., 1980**). Loads were estimated for all five Great Lakes.

2. METHODS

The total tributary load comprises diffuse and point-source loads from both monitored and unmonitored areas. Tributary loads from monitored areas were calculated with a ratio-estimator technique described in **Dolan et al.**

*GLERL Contribution No. 438.

(1981) and in a report by the International Joint Commission (1976). The method calculates an average daily tributary load at the mouth from concentration and flow data at an upstream gauging station and then adjusts it to account for the variability of flow over an annual cycle. Diffuse loads from unmonitored areas were estimated from diffuse loads from monitored areas with similar basin characteristics.

Monitored point sources are those point sources discharged upstream from a gauging station and unmonitored point sources are those point sources discharged downstream from a gauging station. Municipal phosphorus loadings provided by the International Joint Commission (1982) were used to update point-source loading data. Where information was not available, loading data were extrapolated from data found in state records. Instantaneous concentration and flow data were obtained from the U.S. Environmental Protection Agency's STORET system. Mean daily and mean annual flow data were obtained from the U.S. Geological Survey.

Detailed descriptions and examples of the methods used in calculating total river mouth loads from monitored and unmonitored areas are presented in Sonzogni et al. (1978). Descriptions of the U.S. Great Lakes tributaries, their river basin group classifications, and maps of their drainage basins can be found in Hall et al. (1976).

3. RESULTS

Tables 1 and 2 present the U.S. Great Lakes Basin tributary loads, the percentage of the load obtained from monitored areas, and the percentage of the load obtained from diffuse sources for Water Years 1979 and 1980. Load estimates are presented for total phosphorus, soluble orthophosphorus, suspended solids, chloride, total nitrogen, ammonia nitrogen, and nitrate (+ nitrite) nitrogen. Table 1 displays the lake totals and the U.S. Great Lakes Basin totals. Table 2 lists the loads for individual hydrologic areas and river basin groups. Annual river mouth loads are in units of metric tons, and percentage monitored and percentage diffuse are in parts per hundred. All values have been rounded to two significant figures.
